

Non Working 3D Printer and Laser Attachments

If you are not have success with your 3D Printer Attachment and your Laser Attachment use follow this guide.

Written By: BoXZY

Step 1 — Problem

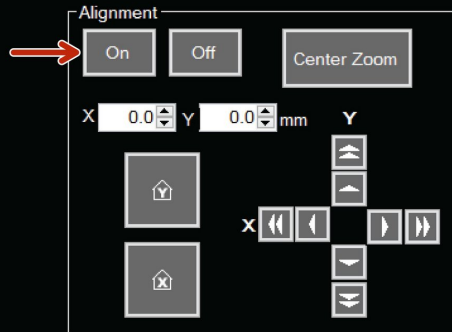

- 3D Printing Attachment Fan is not working
 - AND...
- Laser Attachment laser is not projecting
- ❗ If you are having these problems please continue this guide to verify the issue and fix the problem

Step 2 — Double Checking

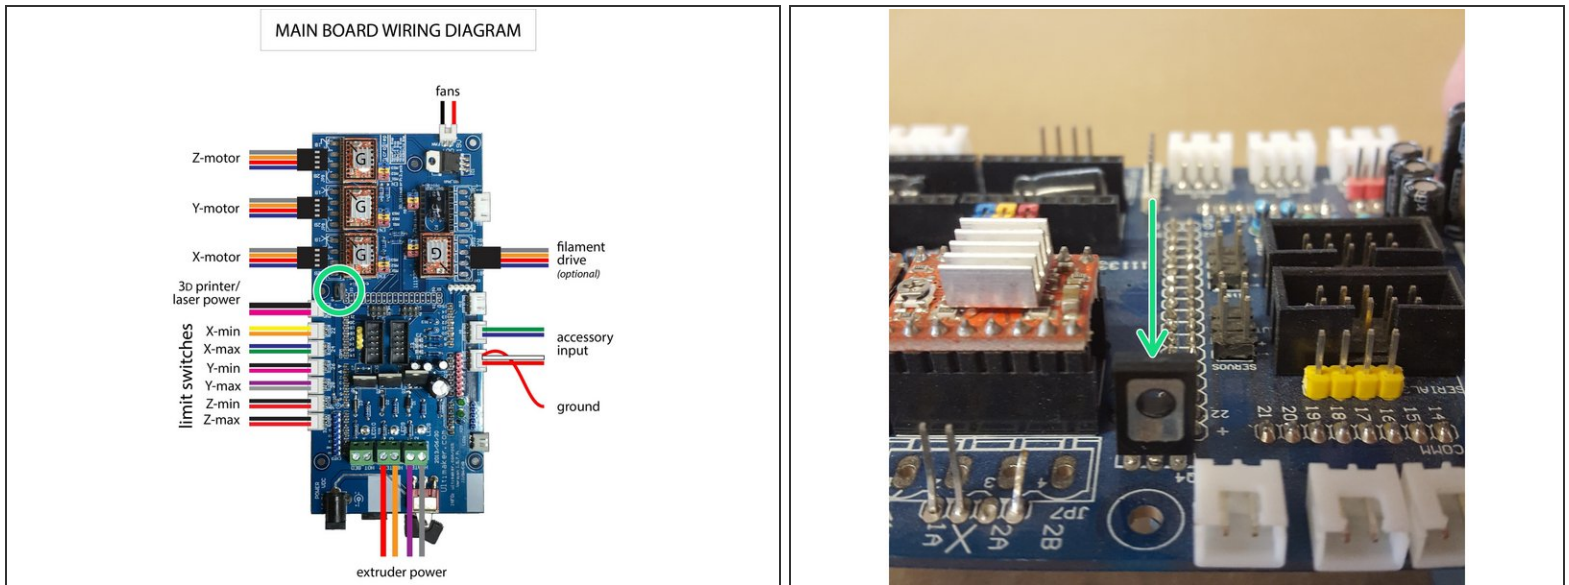

- **Insert** your *3D Printing Attachment* into BoXZY
 - **Connect** the **Wiring Harness** cables to both the *Limit Switch Connector* and the *3D Printing Connector*
- Turn the **Extruder ON** and set the Temperature to *180 degrees*
- Turn the **Fan ON**
- ❗ If the 3D Printing Attachment Fan is not on or the 3D Printing Head is not being recognized by the Interface move on to the next step of this guide

Step 3 — Double Checking

- **Insert** your *Laser Attachment* into BoXZY
- **Connect** the **Wiring Harness** cables to both the *Limit Switch Connector* and the *Laser Attachment Connector*
- Turn the **Alignment ON** in your BoXZY Interface Laser tab
 - This will turn the Laser Diode **ON** and project a very low powered laser beam
- ① If you do not see a blue dot or blue laser beam then continue to the next step

Step 4 — Problem Solving

- This issue is a transistor problem
- The first image is BoXZY's breakout board diagram
 - The transistor that is a problem is indicated by the *green circle* and *green arrow* in the images
 - This is the **Q4 Transistor** and it will need to be replaced
- ❗ If you can solder you can replace it yourself by following the next few steps of this guide

Step 5 — Transistor Replacement: Part 1

- **Disconnect** the *Power Station* and the *USB* from BoXZY
- **Remove** the *Electronics Cover* by lifting up on it, the cover uses Key Holes and 4 bolts to lock it in place
 - ☑ The *Fans* on the Electronics cover and the *Wiring Harnesses* are connected to the Electronics Boards. **DO NOT** Disconnect anything
- **Locate** the transistor, as indicated in the last step of this guide and the images in this step
- **Clip Off** the old transistor at the base of the black portion leaving the original "legs" intact (alternatively you can just heat the legs and remove the solder for a "proper" repair)

Step 6 — Transistor Replacement: Part 2

- **Match** the direction of the *Original Transistor* and set the New Transistor legs over the original legs that are sticking up from the board
- **Solder** the old legs to the new legs
 - ⓘ Solder one leg at a time, remove the iron and allow the transistor to cool between solder the legs
 - ⚠ Be careful not to allow the transistor to heat up from the soldering iron

Step 7 — Fin

- Now you can replace the Electronics Cover, reconnect any wire you may have disconnected and power up BoXZY
